Submitted (07-SEP-2000) Genoscope - Centre National de Sequencage, 2 rue Gaston Cremieux, CP 5706, 91057 EVRY cedex, FRANCE. (E-mail : seqrefégenoscope.cns.fr - Web : www.genoscope.cns.fr]
This STS is part of a random genomic sequencing program of thirteen yeast species: Saccharcomyces bayanus var. uvarum, Saccharcomyces ervazzii, Zygosaccharomyces rouxii, Saccharcomyces servazzii, Zygosaccharomyces rouxii, Saccharcomyces kluyverimyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces marxianus var. marxianus, Pichia angusta, Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarrowia lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            <577. .>846

Mus musculus clone RP23-441L2, WORKING DRAFT SEQUENCE, 56 unordered
pieces.
                                                                                                                                                                                                                                                                                                                                           2 (bases 1 to 269726)
DOE Joint Genome Institute.
Direct Submission
Submitted (10-JAN-2000) Production Sequencing Facility, DOE Joint
Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA
On Jul 15, 2000 this sequence version replaced gi:6980210.
                                                                                                                                                                                                                                                  Eukaryota, Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus. 1 (bases 1 to 269726)
DOE Joint Genome Institute.
                  Summary Statistics
Consensus quality: 205453 bases at least Q40
Consensus quality: 22960 bases at least Q30
Consensus quality: 229624 bases at least Q30
Consensus quality: 229624 bases at least Q30
Consensus quality: 229624 bases at least Q30
Estimated insert size: 240000; pulse field gel estimation
Estimated insert size: 240205; sum-of-contigs estimation
Quality coverage: 8.31 in Q20 bases; pulse field gel estimation
Quality coverage: 8.11 in Q20 bases; sum-of-contigs estimation
• NOTE: This is a "working draft' sequence. It currently
• consists of 56 contigs. The true order of the pieces
• is not known and their order in this sequence record is
GluValValGlnSerAspAsnAlaAlaSerAspAlaTrpGluLysAlaAlaThrProIle 125
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   length

This clone was sequenced as part of a high-throughput process to
This clone was sequenced as part of a high-throughput process to
This clone was sequenced as part of a high-throughput process to
This clone was sequenced or polyA tail and contiguity
This clone was sequenced of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to
reflect accurately this particular cDNA clone. However, there are
artifacts associated with the generation of cDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contaminating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAS, and
reverse transcription of unspliced precursor RNAS, and
reverse transcription and volut this sequence, including its location
and relationship to other sequences, please visit our Web site

Further downstream, following a 12-residue unique 'spacer. region' (S), there is a stretch of 55 amino acids repeated three times, C1, C2 and C3. The latter regions are interrupted by two 15-residue regions, called D1 and D2. Directly following these repeats there is a region which consists of a repetitive, extremely hydrophilic, structure containing several proline residues. This region resembles a similar structure in the streptococcal M protein and in protein A, which is thought to mediate the binding of the protein to the cell wall.

Gene="HCM2.0006c, possible lipoprotein, len: 280 aa;

//doce="HCM2.0006c, possible lipoprotein, len: 280 aa;

//doce="HCM2.0006c, possible lipoprotein, len: 280 aa;

shows weak similarity to TR:AAF10061 (EMBL:AE001907),

DR0482, Deinococcus radiodurans B-cell receptor associated protein-related protein (328 aa), fasts scores; E(): 4.9e-07, 23.4% identity in 265 aa overlap. Highly similar to TR:CAB55231 (EMBL:AL117211), YPMT1.49C, Yersinia pestis CO-92 putative lipoprotein from plasmid pwr1 (276 aa), fasta scores; E(): 0, 97.5% identity in 280 aa overlap and TR:C68763 (EMBL:AF074611), Y1114, Yersinia pestis KIM5 hypothetical protein from plasmid pwr1 (276 aa), fasta scores; E(): 0, 97.5% identity in 280 aa overlap. Contains a possible N-terminal signal sequence and an appropriately positioned PS00013 Prokaryotic membrane lipoprotein lipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           highly similar to TR:CAB62372 (EMBL:AL117211), YPWT1.49AC, Yersthia pestis CO-92 hypothetical protein from plasmid pWT1 (66 aa), fasta scores; E(): 3.5e-25, 97.0% identity in 66 aa overlap. Contains hyrophobic, possible
